

Patient Testimonial

"I felt no pain! The procedure went great and I can tell a difference in my energy level already!" ----Linda (4 days after procedure).

"Procedure was quick and painless, and I appreciate that I do not have to take time out for injections now." --- Bill

"I have noticed an improvement with menopause symptoms within a few days. I used to experience mood swings and chronic fatigue. Since the hormone implant, I feel more stability in my emotions."--- Eileen

Mood Swings, Fatigue, Weight Gain?

Try Hormone Therapy with
Pellet Implants!

Superior to other methods of delivery such as injections, creams and gels. Hormone Pellets deliver consistent steady levels of hormones to your body, relieving you from hormonal fluctuations!

Why Hormone Pellets?

Years of research and studies have shown hormone pellet therapy is the most effective in replicating the body's hormone levels. There are several advantages to choosing this method of hormone replacement.

Convenient: The pellets are implanted once every several months versus either applying cream or injections weekly.

Safety: Unlike other hormone replacement options, the pellets allow the body to absorb the amount of hormones it needs directly to the blood stream, bypassing the liver. Bypassing the liver reduces the risk of blood clots which causes issues with thrombosis, stroke and heart disease. Additionally, pellets do not have the same risk of breast cancer as the synthetic progestin or synthetic Methyl-testosterone.

Side Effects: Natural hormone pellets have no side effects. They will not adversely affect blood pressure, lipid levels, glucose or liver functions.

Dosing Consistency: Delivers the most consistent, reliable levels of hormones to your body so you

avoid the notable symptoms associated with fluctuations in hormone levels.

What Conditions Are Treated?

Hormone Pellet Implants are recommended for men and women and can successfully treat the following conditions related to hormone imbalances:

- ❖ emotional lability
- ❖ fatigue and loss of stamina
- ❖ Breast Tenderness
- ❖ Loss of Libido
- ❖ Sleep Disturbance
- ❖ Muscle Weakness
- ❖ Pre-menopause/Post-menopause
- ❖ Andropause

Consistent, uninterrupted hormone pellet implant therapy over several months can also improve bone density.

How Does it Work?

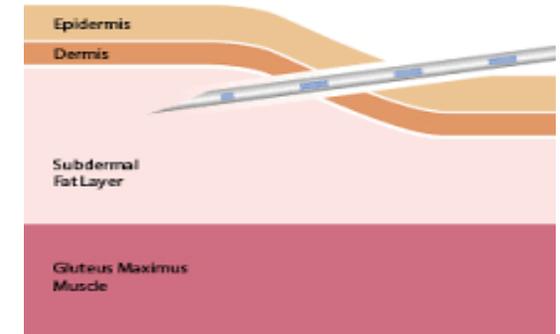

Hormone Pellets are about the size of a grain of rice!

Using a pharmacy that meets and exceeds FDA requirements, pellets are compounded in varying doses of Estradiol, Testosterone, and Anastrozole.

Each pellet lot is sterilized and quality tested before they are distributed.

To ensure proper doses of pellets are ordered for you – you will be required to have hormone panel laboratory testing done within 3 months prior to the procedure.

Understanding the Procedure

Hormone Pellets are implanted subcutaneously above the gluteus maximum muscle. The doctor or nurse practitioner will use local anesthesia, make a small incision and then the hormone pellet is implanted under the skin. Your wound will take 5-7 days to heal which you will be asked to avoid vigorous physical activity and tub bathing.

Please note: The pellets and implant procedure will not be billed to insurance. Be sure to ask our staff about our affordable pricing!
