Oxytocin is a 9 peptide (amino acid) hormone secreted by the posterior pituitary. It has actions both in the brain and peripherally in the body. Oxytocin is released in large amounts during childbirth. Oxytocin is also released by both males and females during orgasm and is thought to be the hormone of desire and bonding. Vast arrays of studies have shown that oxytocin plays a large role in many aspects of overall health. Low oxytocin can be associated with several conditions such as sexual related dysfunction, post-traumatic stress disorder, psychological disorders, depression and anxiety, weight loss, addictions, and chronic pain.
